STL SACRAMENTO PROJECT NUMBER: G6C030290
PO/CONTRACT:Paul Rosenfeld
Soil Water Air Protection Enterprise
201 Wilshire Ave, Second Floor
Santa Monica, CA 90401

Dear Dr. Rosenfeld,

This report contains the analytical results for the samples received under chain of custody by STL Sacramento on March 3, 2006. These samples are associated with your Florala project.

The test results in this report meet all NELAC requirements for parameters that accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The case narrative is an integral part of this report.

If you have any questions, please feel free to call me at (916) 374-4427.

Sincerely,

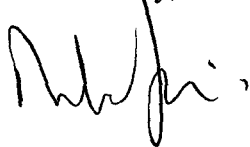

Nilo Ligi
Project Manager

TABLE OF CONTENTS

STL SACRAMENTO PROJECT NUMBER G6C030290

Case Narrative

STL Sacramento Quality Assurance Program

Sample Description Information

Chain of Custody Documentation

BIOLOGIC, 8290, Dioxins/Furans, HRGC/HRM

Samples: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15

Sample Data Sheets

Method Blank Reports

Laboratory QC Reports

CASE NARRATIVE

STL SACRAMENTO PROJECT NUMBER G6C030290

BIOLOGIC, 8290, Dioxins/Furans, HRGC/HRM

Sample(s): 1, 2, 3, 4, 5, 6, 7, 8

The method blank shows some hits for target analytes. All hits are well below the lower calibration limit. The chromatographic profile suggests that there may be a very small contamination from the LCS spike. All samples with hits for these analytes will be "B:" flagged.

Sample(s): 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15

It was noticed during the initial centrifugation that the serum did not fully separate from the red blood cell as the color of the samples were deep red.

Sample(s): 9, 10, 11, 12, 13, 14, 15

The ending standard, ST0404B from data file, 04AP068D5 had a response of -22.7% for 1,2,3,4,7,8-HxCDD between 20 and 25%. Per the method, an average response factor of the initial and ending standards for this analyte will be calculated (0.76) and applied to all associated samples with a positive result. Negative results are not impacted by this observation.

Sample(s): 9, 10, 14, 15

Field samples 9,10,14,15 from lot G6C030290 have several internal standards (IS's) with a low, failing recovery; these may be attributed to the matrix (blood serum). Rest of field samples, although passing, demonstrate a similar low recovery trend. No corrective action will be taken.

BIOLOGIC, 8290, Lipids, Percent

Sample(s): 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15

The %Lipid determination in blood was performed gravimetrically as hexane extractable material.

There were no other anomalies associated with this project.

QC Parameter Definitions

QC Batch: The QC batch consists of a set of up to 20 field samples that behave similarly (i.e., same matrix) and are processed using the same procedures, reagents, and standards at the same time.

Method Blank: An analytical control consisting of all reagents, which may include internal standards and surrogates, and is carried through the entire analytical procedure. The method blank is used to define the level of laboratory background contamination.

Laboratory Control Sample and Laboratory Control Sample Duplicate (LCS/LCSD): An aliquot of blank matrix spiked with known amounts of representative target analytes. The LCS (and LCSD as required) is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects. If an LCSD is performed, it may also used to evaluate the precision of the process.

Duplicate Sample (DU): Different aliquots of the same sample are analyzed to evaluate the precision of an analysis.

Surrogates: Organic compounds not expected to be detected in field samples, which behave similarly to target analytes. These are added to every sample within a batch at a known concentration to determine the efficiency of the sample preparation and analytical process.

Matrix Spike and Matrix Spike Duplicate (MS/MSD): An MS is an aliquot of a matrix fortified with known quantities of specific compounds and subjected to an entire analytical procedure in order to indicate the appropriateness of the method for a particular matrix. The percent recovery for the respective compound(s) is then calculated. The MSD is a second aliquot of the same matrix as the matrix spike, also spiked, in order to determine the precision of the method.

Isotope Dilution: For isotope dilution methods, isotopically labeled analogs (internal standards) of the native target analytes are spiked into the sample at time of extraction. These internal standards are used for quantitation, and monitor and correct for matrix effects. Since matrix effects on method performance can be judged by the recovery of these analogs, there is little added benefit of performing MS/MSD for these methods. MS/MSD are only performed for client or QAPP requirements.

Control Limits: The reported control limits are either based on laboratory historical data, method requirements, or project data quality objectives. The control limits represent the estimated uncertainty of the test results.

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight

13C-1,2,3,4,6,7,8-HpCDF	28 *	40 - 135

Notes:

TEF values are cited in U.S. Environmental Protection Agency, (1989) Interim procedures for estimating risks associated with exposures to mixtures of chlorinated dibenzo-p-dioxins and -dibenzofurans (CDDs and CDFs) and 1989 update. U.S. Environmental Protection Agency, Risk Assessment forum, Washington, DC; EPA/625/R-89/016

- * Surrogate recovery is outside stated control limits.
- B Method blank contamination. The associated method blank contains the target analyte at a reportable level.
- J Estimated result. Result is less than the reporting limit.

STL SACRAMENTO PROJECT NUMBER: G6C060130
PO/CONTRACT:

Paul Rosenfeld
Soil Water Air Protection Enterprise
201 Wilshire Ave, Second Floor
Santa Monica, CA 90401

Dear Dr. Rosenfeld,

This report contains the analytical results for the samples received under chain of custody by STL Sacramento on March 6, 2006. These samples are associated with your Florala project.

The test results in this report meet all NELAC requirements for parameters that accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The case narrative is an integral part of this report.

If you have any questions, please feel free to call me at (916) 374-4427.

Sincerely,

Nilo Ligi
Project Manager

TABLE OF CONTENTS

STL SACRAMENTO PROJECT NUMBER G6C060130

Laboratory QC Reports

CASE NARRATIVE

STL SACRAMENTO PROJECT NUMBER G6C060130

BIOLOGIC, 8290, Dioxins/Furans, HRGC/HRM

Sample(s): 1, 2, 3, 4, 5, 6

The ending standard, ST0328I from data file, 28MR06A8D5 had a response of - 20.8% for 1,2,3,4,7,8-HxCDD between 20 and 25%. Per the method, an average response factor of the initial and ending standards for this analyte will be calculated (0.75) and applied to all associated samples with a positive result. Negative results are not impacted by this observation.

Sample(s): 1, 2, 3, 4, 5, 6

The method blank shows some hits for target analytes. All hits are well below the lower calibration limit. The chromatographic profile suggests that there may be a very small contamination from the LCS spike. All samples with hits for these analytes will be "B:" flagged

BIOLOGIC, 8290, Lipids, Percent (8290),

Sample(s): 1, 2, 3, 4, 5, 6

The %Lipid determination in blood was performed gravimetrically as hexane extractable material.

There were no other anomalies associated with this project.

QC Parameter Definitions

QC Batch: The QC batch consists of a set of up to 20 field samples that behave similarly (i.e., same matrix) and are processed using the same procedures, reagents, and standards at the same time.

Method Blank: An analytical control consisting of all reagents, which may include internal standards and surrogates, and is carried through the entire analytical procedure. The method blank is used to define the level of laboratory background contamination.

Laboratory Control Sample and Laboratory Control Sample Duplicate (LCS/LCSD): An aliquot of blank matrix spiked with known amounts of representative target analytes. The LCS (and LCSD as required) is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects. If an LCSD is performed, it may also be used to evaluate the precision of the process.

Duplicate Sample (DU): Different aliquots of the same sample are analyzed to evaluate the precision of an analysis.

Surrogates: Organic compounds not expected to be detected in field samples, which behave similarly to target analytes. These are added to every sample within a batch at a known concentration to determine the efficiency of the sample preparation and analytical process.

Matrix Spike and Matrix Spike Duplicate (MS/MSD): An MS is an aliquot of a matrix fortified with known quantities of specific compounds and subjected to an entire analytical procedure in order to indicate the appropriateness of the method for a particular matrix. The percent recovery for the respective compound(s) is then calculated. The MSD is a second aliquot of the same matrix as the matrix spike, also spiked, in order to determine the precision of the method.

Isotope Dilution: For isotope dilution methods, isotopically labeled analogs (internal standards) of the native target analytes are spiked into the sample at time of extraction. These internal standards are used for quantitation, and monitor and correct for matrix effects. Since matrix effects on method performance can be judged by the recovery of these analogs, there is little added benefit of performing MS/MSD for these methods. MS/MSD are only performed for client or QAPP requirements.

Control Limits: The reported control limits are either based on laboratory historical data, method requirements, or project data quality objectives. The control limits represent the estimated uncertainty of the test results.

Sample Summary

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight
